

Participant 1

Pre-test Questionnaire

- How old are you, and what do you do?
22 years old, student at Georgia Tech studying computer science
- How proficient in technology are you?
Moderately proficient
- How often do you check the weather? What do you usually use to check the weather?
Checks the weather through a widget on their cell phone home screen
- What is your preferred weather information service? Have you used weather.gov before today?
 - If yes, what were you trying to find? (*Open-ended*)
Apple Weather, has never used weather.gov before
- How often do you check the weather and in what situations?
 - What device do you check weather on
Check every morning to see if there is anything immediate they have to worry about

Post-test Questionnaire

- Did you feel overwhelmed by text in any part of the website? Where?
Overwhelmed by the sheer amount of text, found the text available to be unhelpful
- If you were to use this website consistently, what aspects would you like to see improved?
Information should be prioritized more efficiently(temperatures, precipitation, daily forecast)
- What did you think about the information displayed on the home page?
Home page is overwhelming and not the information that the average user would need
- What were your biggest frustrations using the website?
Some information is too difficult to access, it is difficult to navigate all the complex menus
- What do you think about infographics, and layout of the website

The information was not displayed in a usable manner, was simply raw text in some scenarios

- Was the website easy, and simple to navigate? Why?

It was not easy to navigate due to the overwhelming menus and lack of proper information prioritization. It did not seem as though it was prioritizing user experience.

- Did you find the website aesthetic? What would you change in the design?

Personally liked the design, but does not believe that other people would agree. Information prioritization is the biggest part. The UI does not have to be the most visually appealing but the design should prioritize giving the user what they want.

Insights/Suggestions for Improvement

- **Make the menus easier to navigate/consolidate information**
- **Display the most important information on the home page (daily forecast by city, not national weather alerts)**
- **Improve the display of certain data points/files rather than showing them as raw text**

Participant 2

Pre-test Questionnaire

- How old are you, and what do you do?
- How proficient in technology are you?
- How often do you check the weather? What do you usually use to check the weather?
- What is your preferred weather information service? Have you used weather.gov before today?
 - If yes, what were you trying to find? (*Open-ended*)
- How often do you check the weather and in what situations?
 - What device do you check weather on

Post-test Questionnaire

- Did you feel overwhelmed by text in any part of the website? Where?
 - A lot to look at, not very linear, spent a long time scanning pages than finding the information clearly.
- If you were to use this website consistently, what aspects would you like to see improved?
 - Simplicity is key, far too complicated in organization, although understanding that the weather is deep in information

- What did you think about the information displayed on the home page?
 - Cool to see initially, get a broader sense of weather in the country
- What were your biggest frustrations using the website?
 - How hidden many things are, website feels more like a scavenger hunt than an educational system, forecast page for instance
- What do you think about infographics, and layout of the website
 - Structure of the website is intact but unclear, the animations are solid
- Was the website easy, and simple to navigate? Why?
 - Some aspects it was linear, some specific aspects are still difficult to find immediately
- Did you find the website aesthetic? What would you change in the design?
 - Most areas are aesthetically pleasing, but as you scroll past the infographics it becomes much less pleasing to the eyes

Insights/Suggestions for Improvement

- The listing of temperatures of cities should be much more present, it being a link inside the large list is not ideal
- Does not immediately pull up the forecasts for counties clearly when searched, could be more present.

Participant 3

Pre-test Questionnaire

- How old are you, and what do you do?
 - **22, MSCS student at Georgia Tech**
- How proficient in technology are you?
 - **I'd say pretty proficient - CS graduate from Georgia Tech, ex-software engineering intern.**
- How often do you check the weather? What do you usually use to check the weather?
 - **Daily before leaving the house - I just use Apple's weather app**
- What is your preferred weather information service? Have you used weather.gov before today? If yes, what were you trying to find? (*Open-ended*)
 - **No, never, never even heard of it. I just use Apple's weather app.**
- How often do you check the weather and in what situations? What device do you check weather on

- **I check before leaving the house so I know how many layers to wear. I usually check on my iPhone.**

Post-test Questionnaire

- Did you feel overwhelmed by text in any part of the website? Where?
 - **Yes, pretty much everywhere, especially the “Forecast” page which has an infinite amount of texts and links to follow**
- If you were to use this website consistently, what aspects would you like to see improved?
 - **Ease of access to commonly used information - things like “report weather events” should be very easily accessible, and everyday tasks like “check temperature right now in my city” should be easier to access than “check weather from 7 years ago”, whereas both share equal priority.**
- What did you think about the information displayed on the home page?
 - **I had no idea what any of it meant, you have to zoom into the colored boxes to even understand what the map is about. Way too much text around it too.**
- What were your biggest frustrations using the website?
 - **How hard it was to navigate - it seems like the classic case of listing out every possible option available to the user, without considering that some are 100x more likely to be used than others.**
- What do you think about infographics, and layout of the website
 - **They both have far too much going on, just too complicated overall. This is the type of layout that may be interesting if you know everything about it (and about weather), as it feels like a “control dashboard”, it’s just very much not new-user-friendly.**
- Was the website easy, and simple to navigate? Why?
 - **No - again, far too much stuff (links, images, colors), menus that didn’t make sense, and in general horrible UI/UX.**
- Did you find the website aesthetic? What would you change in the design?
 - **Far from it, it feels very 20th century-esque. Again, too much information, too many colors, just too much going on in general.**

Insights/Suggestions for Improvement

- **The website should contain a straightforward search mechanism. If its purpose is to have a wide variety of graphs and information, it should at least be easy to search for a specific one without knowing where it is located.**
- **Clearly displaying information that is likely to be accessed, such as temperatures and precipitation forecasts. These are the most common, and yet are mixed with many niche graphs in a list, making them hard to spot just by glancing at the landing page.**

Participant 4

Pre-test Questionnaire

- How old are you, and what do you do?

He is 21 years old and you are student Gatech

- How proficient in technology are you?

highly

- How often do you check the weather? What do you usually use to check the weather?

once a day, default weather app on iphone

- What is your preferred weather information service? Have you used weather.gov before today?

Iphone weather app

- How often do you check the weather and in what situations?

Before he goes to school or if its really cold

- What device do you check weather on

Mobile (iphone)

Post-test Questionnaire

- Did you feel overwhelmed by text in any part of the website? Where?

Alot of places like searching cities up alot of information Every page is overwhelming most of which is not what he is looking for

- If you were to use this website consistently, what aspects would you like to see improved?

Better information when using the search. Better information than the infographic, doesn't look pleasant. For example air quality just isn't anywhere to be found when you search up a city.

- What did you think about the information displayed on the home page?

Thinks the information displayed is not the best. See the map of united states which is helpful? The user would like the hyperlinks below the map to be sorted better as its not alphabetical or anything. Alot of the ui is not interactive such as zooming on cities or counties.homepage is not the best. IT gives very little information.

- What were your biggest frustrations using the website?

Finding the air quality, didn't know where it was in the website itself as it took the user to an

external site.

- What do you think about infographics, and layout of the website

Layout is dated, infographics are also dated. They tell the most obvious relevant information.

They could be helpful if they were put in simpler terms. The user doesn't know what kfcc radar is, or spatial marine is. Having a square with a random jpeg is not very pleasant

- Was the website easy, and simple to navigate? Why?

No, its cluttered, and hasn't been edited in awhile. Wants data to be streamlined and more easy to reach. It is very hard to navigate a lot of small text you just have to search for.

- Did you find the website aesthetic? What would you change in the design?

The website is not aesthetic, the user would want a better map interface. The map is old, more updated map, where they can maybe zoom in rather than having to zoom in the page itself.

Make the maps more interactive. Have a map that you can zoom in and you can get the information of the area you zoomed in on.

Insights/Suggestions for Improvement

The website is generally not pleasant to look at, and the website is really cluttered making it hard to find anything.
